```
np.argwhere?
```

```
Signature: np.argwhere(a)
Docstring:
Find the indices of array elements that are non-zero, grouped by element.

Parameters
----------
a : array_like
    Input data.

Returns
-------
index_array : (N, a.ndim) ndarray
    Indices of elements that are non-zero. Indices are grouped by element.
    This array will have shape ``(N, a.ndim)`` where ``N`` is the number o
f
    non-zero items.

See Also
--------
where, nonzero

Notes
-----
``np.argwhere(a)`` is almost the same as ``np.transpose(np.nonzero(a))``,
but produces a result of the correct shape for a 0D array.

The output of ``argwhere`` is not suitable for indexing arrays.
For this purpose use ``nonzero(a)`` instead.

Examples
--------
>>> x = np.arange(6).reshape(2,3)
>>> x
array([[0, 1, 2],
       [3, 4, 5]])
>>> np.argwhere(x>1)
array([[0, 2],
       [1, 0],
       [1, 1],
       [1, 2]])
File:      ~/.local/lib/python3.10/site-packages/numpy/core/numeric.py
Type:      function
```

In [6]:

```
bolt = np.argwhere(lightningbolt)
bolt
```

Out[6]:

```
array([[ 47,  88],
       [ 47,  89],
       [ 47,  90],
       ...,
       [164, 166],
       [164, 167],
       [164, 168]])
```

Linear Regression

$$m = \frac{\bar{x}\bar{y} - \overline{xy}}{(\bar{x})^2 - \overline{x^2}}$$

$$b = \bar{y} - m\bar{x}$$

Question: how can we extract the xs and ys separately from the result of argwhere?

Hint: review numpy slicing by columns and rows

In [7]:
```
# TODO
# We can first run the argwhere function to find the coordinates where th
# y_coords = coords[:, 0]

bolt[:,0]
bolt[:,1]
```

Out[7]:
```
array([ 88,  89,  90, ..., 166, 167, 168])
```

Question: Why would we want to convert x and y points from int values to floats?

In [8]:
```
# TODO
# We would want to convert x and y points from int values to floats becau
```

In [9]:
```
import numpy

def calculate_regression(points): # input is the result of np.argwhere
    # convert points to float
    points = points.astype(float) #TODO (see astype, https://docs.scipy.o

    xs = points[:, 1] #TODO
    ys = points[:, 0] #TODO
    x_mean = xs.mean() #TODO
    y_mean = ys.mean() #TODO

    xy_mean = np.mean(xs * ys) #TODO

    x_squared_mean = np.mean(xs ** 2) #TODO

    m = (xy_mean - x_mean * y_mean) / (x_squared_mean - x_mean ** 2) #TOD

    b = y_mean - (m * x_mean) #TODO

    return m,b
```

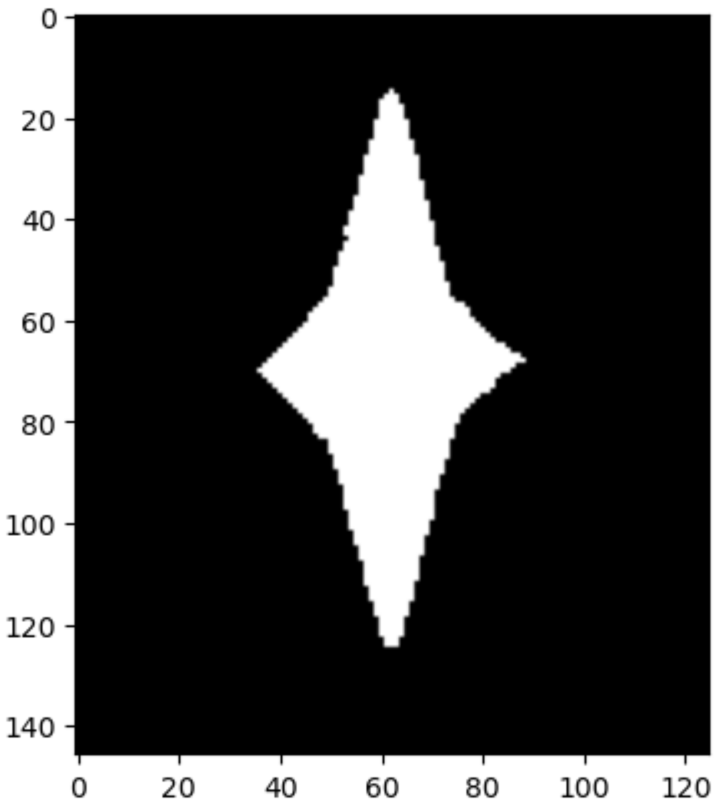
The intercept we calculated, b, may be outside of the pixel space of the image, so we must find two points inside of pixel space, (x_1, y_1) and $(x2, y2)$ which will allow us to plot our regression line on the image. It may be best to choose points on the regression line which also occur on the boundaries/extrema of the image.

In [10]:
```
def find_inliers(m, b, shape):
    x1, y1, x2, y2 = 0, b, shape[1], m * shape[0] + b # TODO
    return x1, y1, x2, y2
    raise NotImplementedError #TODO
```

In [11]:
```
star = cv2.imread('shapes/squishedstar.png', cv2.IMREAD_GRAYSCALE)
print(star.shape)

_, star = cv2.threshold(star,125,255,cv2.THRESH_BINARY)
fig,ax = plt.subplots()
ax.imshow(star, cmap='gray');
```

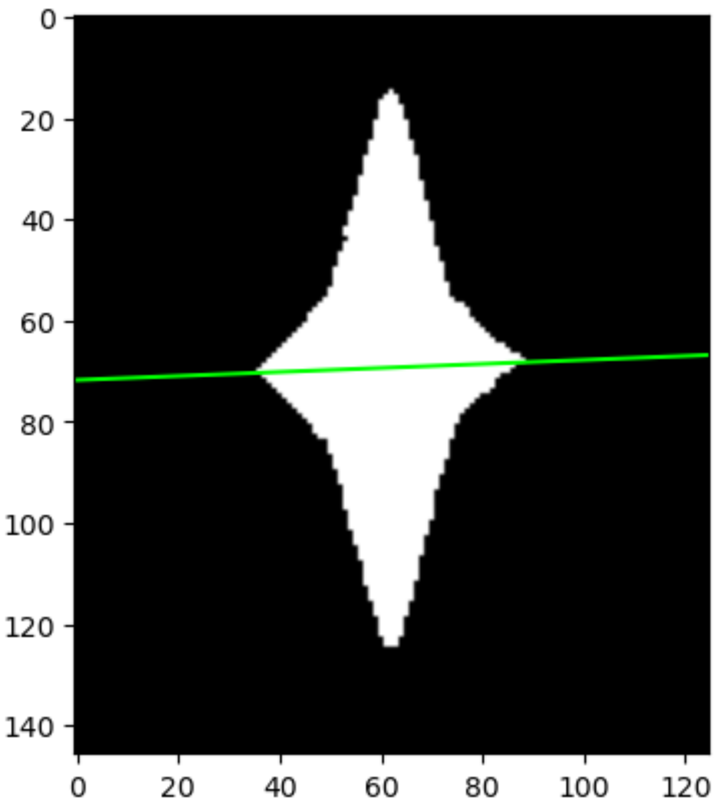
```
(146, 125)
```



In [12]:
```
m,b = calculate_regression(np.argwhere(star))
x1, y1, x2, y2 = find_inliers(m,b, star.shape)
```

In [13]:
```
# below is an example of how to draw a random line from (10,25) to (10,55
# TODO: replace this with the result of find_inliers
# -- pay attention to the directions of the x and y axes
#    in image space, row-column space, and cartesian space
# Look at the help function for Line2D below

fig,ax = plt.subplots()
ax.imshow(star, cmap='gray');
regression = Line2D([x1,x2],[y1,y2], color='lime')
ax.add_line(regression);
```



In [14]:
```
Line2D?
```

```
Init signature:
Line2D(
    xdata,
    ydata,
    linewidth=None,

    zorder: float

See :meth:`set_linestyle` for a description of the line styles,
:meth:`set_marker` for a description of the markers, and
:meth:`set_drawstyle` for a description of the draw styles.
File:           /usr/lib/python3/dist-packages/matplotlib/lines.py
Type:           type
Subclasses:     _AxLine, Line3D
```

TODO

1. Run your linear regression algorithm on the following images.
2. Plot each of the results.
3. Include each result in your submitted PDF.

In [ ]:

```
lightningbolt      = cv2.imread('shapes/lightningbolt.png', cv2.IMREAD_GR
blob               = cv2.imread('shapes/blob.png', cv2.IMREAD_GRAYSCALE)
star               = cv2.imread('shapes/star.png', cv2.IMREAD_GRAYSCALE)
squishedstar       = cv2.imread('shapes/squishedstar.png', cv2.IMREAD_GRA
squishedturnedstar = cv2.imread('shapes/squishedturnedstar.png', cv2.IMRE
letterj            = cv2.imread('shapes/letterj.png', cv2.IMREAD_GRAYSCAL

images = [lightningbolt, blob, star, squishedstar, squishedturnedstar, le
```

When you are done:

You should have six images with regression lines plotted on top of them.

1. Double-check that you filled in your name at the top of the notebook!
2. Click `File -> Export Notebook As -> PDF`
3. Email the PDF to `YOURTEAMNAME@beaver.works`

In [17]:

```
lightningbolt      = cv2.imread('shapes/lightningbolt.png', cv2.IMREAD_GR
blob               = cv2.imread('shapes/blob.png', cv2.IMREAD_GRAYSCALE)
star               = cv2.imread('shapes/star.png', cv2.IMREAD_GRAYSCALE)
squishedstar       = cv2.imread('shapes/squishedstar.png', cv2.IMREAD_GRA
```

```
squishedturnedstar = cv2.imread('shapes/squishedturnedstar.png', cv2.IMRE
letterj            = cv2.imread('shapes/letterj.png', cv2.IMREAD_GRAYSCAL

images = [lightningbolt, blob, star, squishedstar, squishedturnedstar, le
for img in images:
    fig,ax = plt.subplots()
    ax.imshow(img, cmap='gray');

    m,b = calculate_regression(np.argwhere(img))
    x1, y1, x2, y2 = find_inliers(m, b, img.shape)
    regression = Line2D([x1,x2],[y1,y2], color='lime')
    ax.add_line(regression);
```

Stretch goal

Implement a machine learning algorithm!

Random **Sa**mple **C**onsensus, commonly referred to as *RANSAC*, is one of the most widely used machine learning algorithms. In essence, it is a 'guess and check' algorithm. Take a small random sample of your data - two points in this case. Next, define a line through those two points. After doing so, count the number of *inliers*, or points closest to that line (euclidean distance is one way to do this).

https://en.wikipedia.org/wiki/Random_sample_consensus

Implement RANSAC for linear regression, and run it on all of your images.
